Security is a very broad concept. Because its coverage includes political, economic, ecological, military security. This is a very complex process, because if any of the concepts related to security are not provided, the sustainable development of the society cannot be achieved. In the decree of the President of the Republic of Uzbekistan on the action strategy for the further development of the Republic of Uzbekistan ... "to strengthen the independence and sovereignty of the state, to create an environment of security, stability and harmonious neighborliness in our region, to strengthen the positive international reputation of our country in the world community, to strengthen security, religious tolerance and inter-ethnic harmony. strengthening and conducting a thoughtful, mutually beneficial and practical foreign policy <sup>1</sup>. issue is defined in a separate paragraph. It can be seen that even the peace of the country, the well-being of the population, and the development of the state are connected with this security and the concepts related to them. The security system is very extensive. This can include the following:

- national security of the country;
- economic security of society and the state;
- political security of society and the state;
- political, economic, ideological, ecological and other security of the country's territories;
- economic security of every economic entity in the country;
- life, political, spiritual-ideological, economic and other security of every citizen in the country. This list could be continued. But we think that the given part of them is enough for a general understanding.

In this security system, the economic security of the enterprise also plays an important role and has a worthy place. Because in the conditions of market relations, this issue becomes more and more acute.

One of the issues that has a special place in the system of economic security of the enterprise is the economic security of enterprises engaged in service. In order to properly understand and research them, we think that it is necessary to consider the theoretical definitions of several terms related to the concepts of risk, safety and economic security in general. This requires defining the scope of these terms and developing their definitions. But in the economic literature, these concepts have not been researched and, accordingly, their definitions have not been developed. Taking this into account, we found it appropriate to dwell on the definitions of these concepts in this work.

Take security for yourself \_ the most avv a lo danger what is understand get it is necessary because where there is no danger, there is no need for security. We this about our country of scientists to his thoughts we rely For example, B.A. Abdukarimov in the presence of ra h and M. Q. \_ Pardaev in charge in a special way prepared in the textbook danger is defined as follows: "Danger means the possibility of various negative situations such as disaster, misfortune, grief, destruction, loss <sup>2</sup>. " We have given this definition in our brochure <sup>3</sup>. This is a general

understanding of the error, of course. Since the subject of our research is economic security, we think that it is appropriate to approach the issue of risk from this point of view. If we take an economic approach to risk, we think that it can be defined as follows: **"Economic "danger" means the presence of negative situations such as disaster, misfortune, sorrow, destruction, bankruptcy, failure in competition, which cause various economic damages and losses to society, the state, economic entities and individuals** . This concept is a general concept given to economic risk.

When one side of anything is determined, it is possible and necessary to determine its other side. This is directly related to the concept of danger. In particular, it is not difficult to know what security is once the danger has been identified. Based on the above-mentioned concept, safety is defined as follows by scientists dealing with this issue: "Safety means a set of measures that prevent these risks and ensure the stable operation of an object. <sup>4</sup>" This concept is a general concept given to security. However, the time demands further improvement of this concept based on today's requirements. Taking this into account, we defined the concept of security as follows: **Security means a set of measures that prevent possible dangers and ensure the peaceful and stable operation of an object <sup>5</sup>.**
